OUT IS IN™
HEADS UP!

1. We recommend closing and locking and throwing the deadbolts on the doors and drawer before driving away.

2. Check Wheel Lugs: On your first trip tighten wheel lugs at start and at 10, 25, and 50 miles. Thereafter, check wheel lugs before each trip, after excessive breaking and following winter. Always tighten to the manufacturer’s specification of 90 ft. lbs.

3. Keep an eye out – make a habit of walking around your habitat before you set out, when filling up at a service station, when hitching up at the campground. Preventative maintenance is always the best.

4. Before driving, make a habit of locking and dead bolting all doors and securing all window latches.

5. If you are driving down a dirt road please go slow, be careful, never wonder if you are about to bottom out! Get out and take a look! Make someone ‘spot’ you. Remember - bumps are bumpier for your habitat.

6. If you got an Overland model then remember that you are four inches taller than usual, are likely to challenge more challenging roads and more likely to be further down the road than others! Great! That also means you should diligent and careful and consider any or all risks in a considered fashion.

7. Have fun!
WELCOME TO the 2021 TIGERMOTH!

Congratulations on your new TigerMoth or Overland TigerMoth! We hope you go somewhere, anywhere. At this point we want to come with you! Go. Then tell us about it!

Buying a habitat is different than buying a vehicle – you don’t just hitch up and go – plotting and planning and outfitting and optimizing is part of the fun. The TigerMoth is a product of course but it is even more an investment in your lifestyle. Your grow into it. We have a set of wonderful Habitat Specialists and an even more wonderful community that will help!

We imagined one or two people, maybe a dog, bombing around to National Parks. What do you imagine? Some of you imagined also having a rooftop tent for kids or guests. We did that. What is next? Let us know how you use it!

The ’21 TigerMoth has some great new changes. There is another small window facing the front of the habitat. If you get an AC that replaces that front facing window and is more aerodynamic that our previous location. The battery box has been moved and enlarged to support two batteries and shift the center of gravity towards the center. The storage has been enlarged slightly too – under the front part of the bed will safely ‘contain’ larger and more objects.

An Overland edition TigerMoth is available too – it sports a 4” lift and a strong Timbren Axle-less suspension that gets you further down the (dirt) road than any other 12 footer. That lift though does have the effect of making it less and less likely an Overland TigerMoth squeezes into your garage. Measure!

Please have a great time. Please support our nations’ park systems. It takes work to keep things wild.

Please take what you need and leave nothing behind! Keep everyone else’s adventures pristine. Please be safe!

It is important that you thoroughly review this Owner’s Manual. Please also consult it anytime you have a question regarding the use, operation and maintenance of your habitat, and its systems and components. Your TigerMoth habitat has multiple systems, parts, and components, and understanding how they work is an important part of having a fun, safe travel experience.

We want your first and every adventure to be great. Have a practice session in your driveway. Hitch that habitat up and drive it around the block. Get comfortable. Ask questions! Get answers to any questions, issues or problems that arise during your practice. Get answers from the tribe, from our FAQs, at your dealer or call us up. Give us a call or email us at customerservice@taxaoutdoors.com. Many questions can be answered quickly and easily and save you a lot of hassle.

Best,
Garrett Finney,
TAXA Founder
YOUR OWNER’S MANUAL (AND OTHERS)

Make this Owner’s Manual a permanent part of your habitat, download it to a smart device you carry with you or print it out to keep it with the habitat at all times. Keep the manuals, stickers and tags associated with your habitat’s items, add-ons, appliances and equipment in the habitat as well for easy reference. All manuals including components with pass thru warranties etc are available on our website on the MANUALS page - https://taxaoutdoors.com/manuals/

This manual is not intended to be inclusive of every operational aspect of your unit. It should be utilized and referenced by you in conjunction with the separate, additional manuals provided by the manufacturers of the different components, component parts, appliances, add-ons, systems, and accessories in your unit. Your unit will contain any such manuals provided to Taxa Inc. by the specific component part, appliance, add-on, system, and accessory manufacturer. Please read them to gain a more complete understanding of the operation and maintenance of the products and appliances installed in your habitat.

READ THE ENTIRE MANUAL AND OBEY ALL CAUTION, WARNING, DANGER AND OTHER SAFETY-RELATED STATEMENTS PRIOR TO OPERATING YOUR HABITAT.

please note

This Owner’s Manual contains the most up-to-date product information available at the time of publication. However, due to continuous product development, innovation and improvements, Taxa Inc. reserves the right to make changes in production techniques/processes, product materials, product specifications and components. Such changes may be made without prior notice or any obligation upon Taxa Inc. to make corresponding changes or improvements in or upon its already manufactured, installed and/or sold habitats and/or products. Please visit our website at www.taxaoutdoors.com, https://taxaoutdoors.com/manuals/ to check for manual updates and our current manual.

SAFETY TERMS

We have included various safety messages in this manual, all of which are important. Please read and obey them. The following are safety-related terms and symbols referred to in this manual and their corresponding meanings/definitions:

DANGER indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury.

WARNING indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury.

CAUTION indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury.

NOTICE is used to address practices not related to personal injury. This applies to hazardous situations involving property damage or important information regarding the maintenance of your vehicle.
OVERVIEW OF SAFETY PRECAUTIONS

You’ll find various safety-related references, discussions and instructions throughout this owner’s manual, and all of them are important. This overview is not an exhaustive list of the safety issues discussed or contemplated in this manual. Please carefully read and follow all safety issues discussed in this manual. If you have any questions regarding habitat safety issues, please contact your dealer and/or Taxa Inc. - customerservice@taxaoutdoors.com takes you to all of us – general questions, service, warranty, sales)

The following is a broad snapshot of a few of the more common safety instructions/discussions/issues in the use and operation of your new habitat:

- Be sure load/cargo weight does not exceed your GVWR and that weight is distributed properly before travel. Please refer to the “Loading” section.
- Fully close-up and lock your habitat before towing … to ensure efficient and safe transportation.
- Be sure safety chains and breakaway switch have been properly attached and secured as part of your hitching up process.
- Be sure to have a qualified technician conduct the maintenance, service and adjustments on your brakes periodically and as needed. Do NOT travel until all brake problems, if any, are fixed. See “Brakes” section.
- Test your blinkers, brakes and lights before towing on a public road, confirming that they are working properly and in synchronization.
- Do not allow passengers to ride in the habitat during travel … the transport of people puts their lives at risk and is illegal.
- Tires … be vigilant in your tire inspection and maintenance. Properly maintained tires improve the steering, stopping, traction, and load-carrying capability of your habitat and tow vehicle. Under-inflated tires and over-loaded vehicles are major causes of tire failure. Please refer to “Tires” section for a more detailed discussion on your tires and tire safety.
- Keep your habitat well-ventilated. Please refer to the “Ventilation” section for details.
- Clean your potable water hose, and drain and clean holding tanks periodically and / or as needed.
- Be sure all electrical uses and activities involve proper grounding.

- Reduce fishtailing & sway … excessive sway of your travel habitat can lead to the rollover of the habitat and tow vehicle resulting in serious injury or death. This usually due to incorrectly loading the habitat but can also indicate road conditions or habitat damage. You may choose to install a separately purchased sway control device to help reduce sway. Be sure to contact your dealer or Taxa Inc. if you have any questions regarding sway control device alternatives. Please also refer to the sway and fishtailing discussion in the “Towing” section.
- Generator safety … if you decide to use a generator, do not operate it inside the habitat or in any other enclosed space. Be sure to follow all instructions and warnings in the manual provided with the generator, if any.
- Lug nut torque … be sure wheel mounting nuts (lug nuts) on habitat wheels are tight and properly torqued. Inadequate and/or improper wheel nut torque (tightness) is a major reason that lug nuts loosen. Loose lug nuts can rapidly lead to a wheel separation with potentially serious safety consequences. Refer to a qualified technician before travel if you have any questions regarding your wheel nut torque. See also “Tires” section.
- Appliances and equipment … some TigerMoth equipment (cooktop, furnace, etc.) operate on propane. Propane is highly flammable and contained under high pressure. Improper use may result in a fire and/or explosion. Be sure to follow the instructions and warnings provided by the manufacturer of such appliances, if any.
HITCHING

Our habitats require a 2” diameter hitch ball. (Overland editions are outfitted with a Lock And Roll coupler). Use of any other hitch ball diameter size will create an extremely dangerous condition that can result in separation of the coupler and ball, and/or hitch ball failure. Other than this crucial 2” diameter requirement, there are numerous habitat hitches and hitching components available to you for your habitat. Be sure to consult your tow vehicle manufacturer for hitch and/or hitch assembly alternatives.

Pre-hitch/coupling/trip considerations and inspection .... be sure your hitch and tow vehicle are rated for the Gross Vehicle Weight Rating (GVWR) of your habitat. Remember that the hitch load rating must be equal to or greater than the coupler load (the hitch is attached to the car, the coupler to the habitat). Be sure the hitch size matches the coupler size.

Examine all hitch components before hitching, looking for wear, corrosion, deformations, stripping and cracks. Replace worn, corroded or cracked hitch components before coupling the habitat to the tow vehicle. Be sure the hitch components are tight and that the ball-locking device works freely before coupling the habitat to the tow vehicle. Remember to also inspect the safety chains. Be sure to correct any noted problems or defects before towing the habitat.

Important Note: be sure to raise all habitat jacks and close the habitat fully before driving off after hitching. One of the most common mistakes is to forget to raise a stabilizer jack and bending it.

Your habitat is equipped with a 7-pin connector, which synchronizes the lights of your tow vehicle and habitat. It can also connect their respective braking systems. Your habitat is equipped with electric brakes. Use of electric brakes are not required in every State, however, we strongly recommend that you use them.

WARNING: THE PROPER SELECTION AND CONDITION OF THE COUPLER AND HITCH IS ESSENTIAL TO THE SAFE TOWING OF YOUR HABITAT. A LOSS OF COUPLING MAY RESULT IN DEATH OR SERIOUS INJURY.

WARNING: AN IMPROPERLY COUPLED HABITAT CAN RESULT IN DEATH OR SERIOUS INJURY.

WARNING: USE OF A TOW VEHICLE WITH A TOWING CAPACITY LESS THAN THE LOAD RATING OF THE HABITAT CAN RESULT IN LOSS OF CONTROL, AND MAY LEAD TO DEATH OR SERIOUS INJURY.

Hitching up your habitat will get easier with practice. The hitching steps described below are typical. However, we highly recommend that you also consult the hitching and unhitching instructions associated with your particular tow vehicle and hitching configuration.

Hitching steps:

- for 2” ball:
(1) crank the tongue of the habitat jack until the hitch coupler is raised enough to clear the tow vehicle;

(2) back the tow vehicle to the habitat until the hitch ball or ‘pin’ is directly under the habitat coupler. The use of a backing aid mirror may be helpful, especially if you are hitching alone;

(3) set the parking brake in the tow vehicle;

(4) be sure the coupler latch-locking lever is fully open, and then lower the tongue jack until the ball is firmly seated in the socket;

(5) close the coupler latch and secure it with a locking pin or bolt (you can use the pin that locks the caster wheel on to the front jack, the Lock and Roll comes with a propriety pin); If you cannot get the latch to go down try pulling the tow vehicle forward, or reversing a tiny amount to create clearance or release pressure (this occurs usually when the habitat or tow vehicle is on a small slope or soft ground).

(6) securely attach the safety chains in a crossing pattern to the tow vehicle and confirm that they are properly connected to the habitat. Do not fasten chains to any part of the hitch unless the hitch has holes or loops designed specifically for that purpose, be sure the chains do not drag during towing;

**WARNING: Improper rigging of the safety chains can result in loss of control of the habitat and tow vehicle, leading to death or serious injury, if the habitat un couples from the tow vehicle.**

(7) The electric brakes need to be controlled with a proportional brake controller. Some tow vehicles have these pre-integrated. There are wired and wireless versions available online, at towing centers, etc.

(8) Connect the breakaway switch. Attach and secure the breakaway switch cable to the tow vehicle bumper or frame independently of the safety chains. The following are guidelines for attaching the cable:

   The cable should come straight out from the switch to attach to the tow vehicle
   The switch and cable should be located and secured on the same side of the habitat and tow vehicle
   Do not loop the cable over the hitch ball; the cable may bounce off while the vehicle is moving
   Before towing you may test the breakaway assembly by pulling the pin out of the switch to confirm activation of the habitat electric brakes. See also the diagram/depiction in ”Towing” section.

**WARNING: Do not connect the breakaway switch lanyard to the hitch ball or any part of the hitch assembly.**

Note: your breakaway switch will automatically engage the electric habitat brakes if the safety chains fail during uncoupling.
(8) connect the power cord between the tow vehicle and the habitat, leaving enough slack for the tow vehicle to turn without disconnecting the power cord;

(9) adjust side mirrors;

(10) check all lights on habitat and tow vehicle, ensuring that they are working properly.

(11) confirm the brakes are working properly prior to towing the habitat on a public road. You can, for example, check the operation of the habitat brakes by pulling forward and using the AUTOWBRAKE fob or hand control of any alternate brake controller.

(12) You may, depending on your tow vehicle or intended usage of the habitat, want to consider the use of a weight distributing hitch and or sway bars. These distribute the tongue weight of the habitat further away from the rear and can help in vehicle handling.

FOLLOW ALL INSTRUCTIONS PROVIDED BY YOUR TOW VEHICLE’S TOW PACKAGE MANUFACTURER AND/OR INSTALLER
LOADING

The process of safely and properly loading your habitat should become easier with practice and experience. Please first get familiar with and understand the following terms related to your habitat’s weight, carrying capacity, and rating:

**gross vehicle weight rating (GVWR)** is the maximum permissible weight of the habitat when fully loaded and equipped/outfitted. It includes but is not limited to all weight at the habitat axle(s) and tongue or pin as well as all add-ons, appliances, accessories, potable water, etc. Your habitat’s GVWR is 2100 for the regular TigerMoth, 2400 lbs for the Overland TigerMoth. This number is recorded on the permanent label on the tongue your habitat.

**Dry weight or unloaded vehicle weight (UVW)** is the weight of the habitat as manufactured at the factory (typical weight without loading, no options). It includes all weight at the habitat axle(s) and tongue or pin. Your habitat’s standard UVW (‘dry’ weight) is approximately 1310 lbs for the regular TigerMoth, 1458 lbs for the Overland TigerMoth. However, you will need to account for the weight of dealer or third-party installed add-ons, options and accessories, if any, in determining your actual UVW. In sum, your actual UVW will vary (and increase) to the extent you have outfitted your habitat with additional items. Note: Your cargo carrying capacity (discussed below) will vary (and decrease) to the extent of the weight of dealer or third-party installed add-ons, options and accessories, if any.

**cargo carrying capacity (CCC)** is equal to GVWR minus UVW and potable water weight. Your habitat’s CCC is approximately 890 lbs for the regular TigerMoth, 942 lbs for the Overland TigerMoth. However, remember that your actual CCC will vary (and decrease) to the extent you have outfitted your habitat with additional items. Please refer to the stickers located at the front exterior of your habitat for CCC.

**gross axle weight rating (GAWR)** is the value specified as the load carrying capacity of a single axle system, as measured at the tire-ground interfaces. Your habitat’s GAWR is 2000 lbs for the regular TigerMoth, and 2400 lbs as well for the Overland TigerMoth. Please refer to the sticker located at the front exterior of your habitat for GAWR.

**gross trailer (habitat) weight (GTW)** is the weight of the habitat with all the items and supplies that are loaded into the unit at any point in time and must be less than the allowed GVWR.

WEIGHT GENERALLY

Before towing, you must choose the items you will load onto your habitat and then determine whether the loaded weight is safe and proper. Of course, the best way (highly recommended) to calculate the loaded weight of your habitat is to have it weighed while loaded, and then compare it with the GVWR. Otherwise, you will need to do some calculations on your own in order to make an appropriate determination. If the loaded weight of your habitat exceeds the GVWR, your habitat is overloaded and should not be towed. You will need to remove items from, and reduce the loaded weight of, the habitat until it’s at or below the GVWR before towing. Note: remember to include in your calculations the weight of dealer or third-party installed equipment, options, add-ons, accessories and any other non-standard items. As an additional safety precaution, we recommend that you take a conservative approach when doing your own weight calculations.

WEIGHT/LOAD DISTRIBUTION AND TONGUE WEIGHT

Proper weight and load distribution is essential to safe towing. Load the habitat evenly (front to back and side to side) and securely, keeping heavier items as low as possible. Be sure to secure the load. A firmly secured load will be less prone to shifting and should help maintain load balance during travel.

Tongue (the habitat arm extension that couples with the tow vehicle receiver) weight is the amount of weight borne by the habitat hitch and another important consideration when loading your habitat. Generally, the actual tongue weight should equal approximately 10-15% of the gross habitat weight. Excessive tongue weight will make your tow vehicle’s steering and braking less responsive. Insufficient tongue weight may cause your habitat to sway.

You could weigh your loaded habitat’s tongue to determine the actual tongue weight. However, you may also observe the actual tongue weight and determine if it is too light or too heavy. For example, a habitat with a proper tongue weight will form a straight line from front to back between the tow vehicle and the habitat. A habitat with the weight improperly distributed (i.e. a light tongue weight) will cause the coupling between the tow vehicle and habitat to rise, with the weight pressing down at the rear of the habitat and the front of the tow vehicle. Excessive tongue weight will do just the opposite.

If you notice a rise or fall in your tow coupling, you will need to redistribute the weight of the load before getting on the...
road. If you have trouble estimating the combined weight of your habitat plus cargo, take your loaded habitat to a vehicle scale at a nearby weigh station or truck stop. **Important Note:** you need to also refer to your tow vehicle’s towing capacity and other towing and load capacity-related definitions and instructions before getting on the road. Please also consult your supplying dealer or Taxa Inc. if you have any questions regarding these terms and/or loading your habitat.

---

**example of poor weight distribution**

**proper ~10 to 15% of loaded habitat on tongue**
TOWING

We want your towing experiences and practices to be safe and enjoyable. Please take your time, avoid being in a rush and give special attention to all safety matters prior to and during the towing of your habitat.

As previously indicated, we recommend that you practice towing your TigerMoth in, for example, an empty parking lot before going on your first camping trip. This initial trial and practice is fun and will help you get accustomed to and familiar with TigerMoth®'s systems and operation. Please also make note of any questions, issues or problems that arise during your pre-travel towing practice, and then inquire with your dealer or email us hello@taxaoutdoors.com. You can also visit our website (www.taxaoutdoors.com) for current contact information. Please also refer to the "Overview of Safety Precautions" and "Pre-Travel Checklist" sections before towing your habitat.

safety chains ... We have equipped your habitat with safety chains. Make use of them. Safety chains serve to maintain the connection between your habitat and the tow vehicle in the event of separation of the ball and habitat coupling. Be sure to hook the safety chains to the frame of the tow vehicle (not the hitch), crossing them under the habitat's tongue. Also, remember to inspect the length of the chains once they are attached to the tow vehicle frame. A proper chain length will allow turns and prevent the chains from dragging on the road.

breakaway switch ... Your habitat is equipped with a breakaway switch. For every TigerMoth the breakaway switch is wired to the TigerMoth's internal battery. Breakaway switches are designed to activate the electric brakes in the event your habitat disconnects/uncouples from the tow vehicle. Your habitat battery powers this braking. Ideally, the safety chains will prevent your habitat from disconnecting if the coupler comes off the hitch ball. However, if the safety chains fail, the breakaway pulls the pin out of the switch which fires the brakes and serves as a last line of defense against a runaway habitat. The breakaway switch cable needs to be secured to the tow vehicle bumper or frame independently of the habitat safety chains. The following are guidelines for attaching the cable:

- The cable should come straight out from the switch to attach to the tow vehicle
- The switch and cable should be located and secured on the same side of the habitat and tow vehicle
- Do not loop the cable over the hitch ball; the cable may bounce off while the vehicle is moving
- Before towing you may test the breakaway assembly by pulling the pin out of the switch to confirm activation of the habitat electric brakes. See below

Switch location
Cable attached independently to tow vehicle, with pin secured in switch

Tire pressure ... you are responsible for maintaining proper tire pressure in the tires of your habitat and tow vehicle. Thus, always check your tire pressure and refer to the “Tires” discussion herein before traveling.

brakes ... you are responsible for inspecting and maintaining both your habitat and tow vehicle brakes before towing. Do not tow your habitat unless you have confirmed your brakes are in good condition and operating properly. Be sure to have a qualified technician perform all brake adjustments, service and maintenance. Please also refer to the “Brakes” discussion herein before traveling.

lights ... be sure to check all electrical connections to ensure all lights on the tow vehicle and habitat are functioning properly before traveling. The brake lights, and hazard and turn signals should be in synchronization with the tow vehicle.

stay level ... the habitat and tow vehicle must be level when hitched. Dragging may occur if the hitch is too low. Conversely, if the hitch is too high, the rear of the habitat is exposed to striking higher points in the road.
general towing/driving … drive defensively, anticipating stops, braking early, and never following closely. We recommend maintaining a length of at least three cars and a habitat (approximately 65 ft.) between you and the car in front of you for every 10 mph of speed you are traveling (for example, at 60 mph, you should maintain approximately 390 ft. of distance between your vehicle and the vehicle in front of you). This should give you adequate time to safely complete a proper avoidance maneuver (i.e., come to a safe stop, change lanes, etc.) in the event of, for example, an abrupt stop or emergency.

Longer stopping distances are required when towing a habitat so remember to start braking sooner than you would if driving without your habitat. Begin slowing down well in advance of anticipated street/road dips and depressions. It also takes longer to accelerate when towing a habitat. Thus, remember to account for both the slower acceleration rate and the combined length of your tow vehicle and habitat when passing another vehicle and then safely returning to your lane. In sum, always pass, allow others to pass, and change lanes with care. We also do not recommend using cruise control or overdrive when towing/travelling.

SWAY AND FISHTAILING … excessive sway or fishtailing of your habitat can lead to the rollover of the habitat and tow vehicle, and thus, serious injury or death. The tendency for the vehicle to sway increases with speed. Thus, reduce speed as needed and in inclement or harsh weather conditions (i.e., high winds, rainstorms, slippery roads, etc.). The following are a few tips for reducing sway or fishtailing if and when they occur and are not exhaustive: (1) slow down gradually … do not jam/slam on the brakes or press on the accelerator, both of which may make the situation worse and result in severe injury or death. Instead, remove your foot from the accelerator and reduce your speed gradually whenever possible; (2) minimize and avoid quick steering movements … Quick steering movements will actually cause increased sway and loss of control; Keep both hands on the wheel, and hold the wheel as straight as possible until stability is regained; and As soon as practicable after regaining control … pull over and check tire pressures and cargo weight distribution, and inspect the habitat and tow vehicle for any signs of failure or defect. If you suspect a mechanical failure, recommend that you not tow until the problem is identified and remedied. If you choose to travel, do so at reduced speeds and with heightened caution until the problem can be identified and remedied.

WARNING: Side to side motion (sway) that begins as you reach a certain speed will likely become whipping at higher speeds. As soon as you notice sway, slow your vehicle by letting off the gas pedal. Then stop to check the habitat and tow vehicle as soon as it is safe to do so.

OTHER IMPORTANT TOWING SCENARIOS

winding, narrow roads … stay in the center of the lane. This reduces the likelihood of the tires/wheels dropping onto the shoulder, another potential cause of hazardous sway. Do not cross the center-line unless safely changing lanes.

WARNING: If a wheel goes off the paved roadway, do not steer sharply and do not brake. Let off the gas pedal, slow down below 25 mph and then steer gradually back onto the roadway. Proceed with caution entering traffic.

sharp turns … minimize the suddenness of sharp turns by anticipating them, slowing down well in advance of them, and taking them at low, substantially reduced speeds.

steep, long grades … like sharp turns, be sure to anticipate steep grades. Down-shift into a lower gear or range in advance to assist your braking on a descent and to add power on a climb.

Note: avoid situations that require excessive and prolonged use of the brakes. If unavoidable, apply and release brakes at short intervals to give them a chance to cool. Downshift your tow vehicle to reduce breaking needs on long down grades of highway.

slippery, icy pavement … reduce speed and drive slowly. Remember that skidding/hydroplaning can occur with minimal moisture on the road. If skidding occurs, remove your foot from the accelerator and then gently apply the habitat brakes only.

freeways and highways … try to pick and stay in the far right hand slower lane.

corner turns … habitat wheels do not follow the path of your tow vehicle’s wheels during corner turns. The habitat will make a closer, tighter turn than the tow vehicle. Compensate by moving further into the intersection before turning so that the habitat clears any objects in or near the road such as not limited to the curb and parked vehicles. Left turns require a wider than
normal turn to help prevent the habitat from edging into an opposing lane. Use turn signals early for the traffic behind you and begin slowing down well in advance of your turn.

*mud and sand* ... when going through mud or sand, accelerate gently, if at all, and try to remain in the path of the previous vehicles. Let the momentum of the tow vehicle and habitat carry you through the problem area. If stuck, the habitat and tow vehicle should be towed out while hitched.

dirt, gravel, washboard roads ... go slow, use caution, your habitat will move an vibrate more than the tow vehicle, a good rule of thumb is 25 mph or less, MUCH less on severely rutted roads.

*parking* ... Whenever possible, avoid parking on a grade. If unavoidable, turn the front wheels of your tow vehicle into the curb and set the parking brake. For added safety, place wheel chocks under the habitat wheels.

*additional towing safety information* ... can be found on the National Highway Traffic Safety Administration's web site: http://www.nhtsa.dot.gov/Cars/problems/Equipment/towing/Towing.pdf

**BRAKES**

overview ... your TigerMoth is equipped with electric brakes. *Under normal driving/towing conditions, the habitat brakes will operate only in conjunction with a properly installed brake controller (which is also discussed below).* Please also obtain and read the separate manual of the brake controller.

Important Note: in an emergency uncoupling of your tow vehicle and habitat, your habitat electric brakes will automatically engage without a brake controller. This assumes, of course, that you have properly attached and secured the provided breakaway switch. *See also “Hitching” and “Towing” sections herein.*

*brake controller, breaking-in your brakes and synchronization* ...we recommend that you break-in your habitat brakes in, for example, an empty, paved parking lot, not on a public road, when practicable. To break-in your brakes, apply the brakes at least twenty (20) times, decreasing your speed approximately 20 mph in each application. Allow a few minutes for the brakes to cool between each application so that the brake shoes and magnets “wear-in” to the drum surfaces.

When a brake control or controller is properly installed, your habitat electric brakes will work in synchronization with your tow vehicle brakes. If you sense lock-up, "grabbiness," or your habitat "jerking" or "pushing" the tow vehicle when braking, your braking systems are not properly synchronized. You may need to have small adjustments made periodically because of, for example, changing loads and driving conditions. Brake Controllers are proportionally adjustable and small adjustments are easily made. *Brake Controllers are proportionally adjustable and small adjustments are easily made.* *Important Note: be sure to refer to and follow your brake controller manual for instructions on synchronization, use, maintenance and adjustments.*

CAUTION: Minimum vehicle stopping distances are achieved when wheels approach lock up. Brake lock up should be avoided as it results in poor vehicle stability and control.

*connector* ... your provided 7-pin cord connector located at the front of the habitat transfers electrical power from the tow vehicle battery to the habitat brakes, lighting system, and battery.

*braking tip* ... do NOT use the habitat brakes only. They were designed to provide braking for your habitat, not the tow vehicle. As previously indicated, habitat brakes are not required in every State. Thus, some States may allow you to solely use your tow vehicle’s brakes when towing your habitat. However, remember that the added weight of both the habitat itself and the cargo you are carrying puts additional load pressures on your tow vehicle brakes. It also may, under some conditions (i.e. slippery pavement, loose gravel, etc.), impact overall stability and control of your tow vehicle and habitat. Thus, be sure that you have all the information you need to make an informed decision regarding your brakes before getting on the road.

*brake adjustments* ... generally, brakes should be adjusted after the first 200 miles, every 3,000 miles thereafter, and/or as use and performance requires. *We recommend that you have a qualified technician perform all brake adjustments, service and maintenance.*
TIRES

**size:**
- ST 235/75 R 15 pressure: max 50psi cold,
- LT 225/75 R 16 pressure: max 80 psi cold (Overland)

**overview...** Properly maintained tires improve the steering, stopping, traction, and load-carrying capability of your vehicle. Under-inflated tires and overloaded vehicles are a major cause of tire failure. Maintaining proper tire pressure, tire and vehicle load limits, avoiding road hazards, and regularly inspecting tires for cuts, slashes, and other irregularities are important steps in avoiding tire failure, such as tread separation or blowout and flat tires. These steps, along with other care and maintenance activities, may improve vehicle handling, help protect you and others from avoidable breakdowns and accidents, improve fuel economy and increase the life of your tires. In sum, you are responsible for making tire safety a regular part of your tow vehicle and habitat maintenance routine. Remember that the time you spend is minimal compared with the inconvenience and safety consequences of tire failure.

**proper wheel nut torque** is essential to safe towing. The wheel and axle systems used in habitats are similar in many ways to those found in motor vehicles. However, they differ in several important ways. First, habitat wheels do not steer, and are subjected to high side load stress when making tight turns around corners. This tends to flex the wheel and loosen the wheel nuts. Wheel nut torque requirements vary depending on the size and manufacturer of the wheel.

**TIRE FUNDAMENTALS**

Federal law requires tire manufacturers to place standardized information on the sidewall of all tires. This information identifies and describes the fundamental characteristics of the tire and also provides a tire identification number for safety standard certification and recall matters.

**Sidewall markings and important terms** … your habitat tires should be marked with either a designation of “ST” (i.e. ST235/75/R15, or LT235/75/R15). The “ST” indicates Standard Habitat Service and designed for habitat use only. The “LT” indicates Light Truck Service and designed to be used on vehicles that are capable of carrying heavy cargo.

**maximum load rating** … is the maximum load in kilograms and pounds that each tire can carry.

**maximum permissible inflation pressure** … is the greatest amount of air pressure that should be put in the tire under normal driving conditions.

**max. load single kg (lbs) at kPa (psi) cold** - This information indicates the maximum load and tire pressure when the tire is used as a single.

**load range** … identifies the tire’s load-carrying capabilities and its inflation limits.

**TIRE TREAD**

The tire tread provides the gripping action and traction that helps prevent your vehicle from slipping or sliding, especially when the road is wet or icy. Generally, tires are not safe and should be replaced when the tread is worn down to 1/16 of an inch. The following chart is a general guide for determining the condition of and maintenance action for your habitat tires:

**replacement** … please refer to the tire sidewall on your habitat’s standard tires for information regarding proper tire replacement. Be sure to replace your standard habitat tires with “ST” or “LT” designated tires. Note: replacing your habitat tires with non-ST designated tires will void the Limited Warranty. See Limited Warranty section herein. If you have any doubt about the correct size/type to choose, consult with a tire dealer. Please also refer to the manual provided by your specific tire manufacturer for care and use instructions.

**repair** … the proper repair of a punctured tire requires a plug for the hole and a patch for the area inside the tire that surrounds the puncture hole. Punctures through the tread may be repaired if they are not too large, but punctures to the sidewall should NOT be repaired. Tires must be removed from the rim to be properly inspected before being plugged and patched.

**ALL TIRE REPAIRS SHOULD BE PERFORMED BY A QUALIFIED TECHNICIAN.**

**TIRE PRESSURE AND LOAD LIMITS**
Tire inflation pressure is the level of air in the tire that provides it with load-carrying capacity and affects the overall performance of the vehicle. Because tires may naturally lose air over time, or when driven over objects such as potholes or curbs, it is important to check tire pressure monthly and before every trip.

The tire inflation pressure number indicates the amount of air pressure—a measured in pounds per square inch (psi)—a tire requires to be properly inflated. Vehicle manufacturers determine this number based on the vehicle’s design load limit, that is, the greatest amount of weight a vehicle can safely carry and the vehicle’s tire size. Excessive loads may lead to abnormal tire flex, tire overheating, and ultimately, tire failure. As travel habitats may be set up and loaded in varying ways, proper air pressure should be determined by referencing the information on your tire. Please also refer to the Tire and Loading Information sticker located at the front exterior of your habitat.

The proper tire pressure for your vehicle is referred to as the “recommended cold inflation pressure.” Proper pressure depends on many conditions—terrain, temperatures, altitude, etc. A “cold” tire in this sense is one that has not been driven on for at least three hours. When you drive, your tires get warmer, causing the air pressure within them to increase. Therefore, to get an accurate tire pressure reading, you must measure tire pressure when the tires are cold or account for the extra pressure in warm tires.

WARNING: Improper tire pressure can quickly lead to excessive wear and dangerous situations.

tire pressure steps:
- Locate the recommended tire pressure on the vehicle’s tire.
- Record the tire pressure of all tires.
- If the tire pressure is too high in any of the tires, slowly release air by gently pressing on the tire valve stem with the edge of your tire gauge until you get to the correct pressure.
- If the tire pressure is too low, note the difference between the measured tire pressure and the correct tire pressure. These “missing” pounds of pressure are what you will need to add.

At a service station, add the missing pounds of air pressure to each tire that is under-inflated.
- Check all the tires to make sure they have the same air pressure (except in cases in which the front and rear tires are supposed to have different amounts of pressure).

remember:
Do not exceed the maximum recommended pressure.
The air pressure recommended on the tire information placard is for the original standard equipment tires only. Your habitat may be equipped with optional-sized tires. Always follow the pressure recommendations stamped in the tire sidewall for any replacement tire.
Rotating tires every 5,000 miles or as recommended by the tire manufacturer.

WHEEL NUT TORQUE ADJUSTMENTS

setting torque value on a dial indicator wrench:
Make sure your indicator needle is set to “0”.
As you apply clockwise pressure to the wheel nut, both needles will show the current amount of torque being applied.
When you reach your desired torque value, stop applying pressure and your indicator needle will stay at the highest torque value reached.

setting torque value of adjustable dial wrench:
Unlock the handle and set the dial to your desired torque value.
Lock the handle back in place.
As you apply clockwise pressure to the lug nut, you will hear and audible “click” when the desired torque wrench value is reached.
Do not apply further pressure once you hear the “click”.

pre-trip torqueing procedure:
Be sure to tighten the wheel nuts and torque to 90 lbs. Follow the torque sequence and torque table provided next:
Wheel Nut Torque Table

<table>
<thead>
<tr>
<th>Stage</th>
<th>Torque Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1st Stage</td>
<td>20-25 ft./lb.</td>
</tr>
<tr>
<td>2nd Stage</td>
<td>55-60 ft./lb.</td>
</tr>
<tr>
<td>3rd Stage</td>
<td>85-90 ft./lb.</td>
</tr>
</tbody>
</table>

**Stage 1**  Set your torque wrench to the 1st stage value on the Wheel Nut Torque Table. Begin with the appropriate bolt for your wheel (12 o’clock position for 8 and 6 hole wheels and 2 o’clock position for 5 hole wheels) and apply torque to all wheel nuts following the star pattern as shown in the Wheel Nut Torquing Sequence illustration shown here.

**Stage 2**  Increase your torque wrench setting to the 2nd Stage value on the Wheel Nut Torque Table. Begin with the appropriate bolt for your wheel and apply torque to all wheel nuts following the star pattern. Following stage 2, the wheel can support the weight of the habitat and may be lowered off of the jack stands.

**Stage 3**  Increase your torque wrench setting to Final Torque value on the Wheel Nut Torque Table. Begin with the appropriate bolt for your wheel and apply torque to all wheel nuts following the star pattern.

**Follow-up**  If the wheel was replaced, check the torque again at every 50 miles for the first 500 miles and prior to each trip thereafter.

If you notice a wheel wobbling or hear a rattling sound coming from a wheel, especially at low speeds, a wheel lug may have come loose. This problem is usually caused by improper tightening or by faulty or damaged lug bolt threads. If you have reason to believe a lug nut has come loose, safely stop the vehicle at the side of the road as soon as possible. Put up warning devices. Remove the lug caps and check the tightness of all the lug nuts. If lug bolt threads are damaged or faulty, get professional services help. Do NOT tow the habitat with missing lug nuts or faulty lug bolts.

**Balancing, Alignment and Lubrication**

To avoid vibration or shaking of the vehicle when a tire rotates, the tire must be properly balanced. This balance is achieved by positioning weights on the wheel to counterbalance heavy spots on the wheel-and-tire assembly. A wheel alignment adjusts the angles of the wheels so that they are positioned correctly relative to the vehicle’s frame. This adjustment maximizes the life of your tires. These adjustments require special equipment and should be performed by a qualified technician.

Wheel bearings should be repacked every 6000 miles or every 6 months. Every time the wheel hub is removed, the wheel bearings must be adjusted. Please refer to manufacturer instructions or schedule maintenance with a qualified technician to repack wheel bearings.

**Tire Safety Checklist**

1. Check tire pressure regularly (at least once a month and before any extended trip/travelling), including the spare tires, if any… Note: When checking air pressure, be sure that all tires have both the correct and identical pressure before getting on the road; (2) Check and torque wheel lug nuts regularly; (3) Inspect tires for cuts, slashes, punctures and other irregularities at least on a monthly basis and before every extended trip/travelling; (4) Remove any foreign objects (i.e. pieces of glass or metal, etc.) wedged in the tread; (5) Confirm all tire valves have valve caps; (6) Do not overload your tow vehicle or habitat; (7) Slow down when having to go over a pothole or other object in the road, and avoid running over curbs and other foreign objects in the road and when parking if you can safely do so; (8) Replace tires when tread depth approaches and/or reaches 1/16 of an inch; and (9) Have a qualified technician perform tire service, maintenance and adjustments as needed.
CEILING LIGHT SWITCHES

- Exterior/Kitchen Light
- Table Light
- Ambient Light
- Night Light (red)

POWER OUTLETS AND METER

- Battery Cut-off Switch
- 120V GFCI Outlets
- WFCC Power Center
- USB Outlets
- 12V Outlet
**12V CEILING VENT**

Optional AC replaces window to use plug into outlet with Habitat plugged in to shore power.

Remove AC rain cover before usage.

AC ready to cool.

**OPTIONAL AC AND COVER**

Pull out field kitchen.

TIGERMOTH™ taxaoutdoors.com.
7930 blankenship drive, houston, tx 77055 (rev.03092021)
PLUMBING SYSTEM

TigerMoth™ has no integrated plumbing.

Your TigerMoth may be equipped with a 5-gallon NATO can with gravity spigot.

Drain can if freezing temperatures are expected. Keep interior clean.
ELECTRICAL SYSTEM

Your Tiger Moth’s electrical system is primarily a 12 Volt Direct Current (DC) system and has 120V AC outlets that operate only when attached to shore power. This is explained as follows:

12V DC OVERVIEW

Your habitat 12 Volt system is powered by a 12V battery or batteries (see “Battery” section). Most installed appliances, aside from air conditioning operate fully with 12V power.

7-pin connector ... use your 7-pin connector plug to connect your tow vehicle and habitat electrical systems. This cord is located at the front of your habitat and plugs into a receptacle provided in your tow vehicle’s hitch package. In addition to charging your habitat battery while driving, this connection powers your habitat lights and electric brakes (your TigerMoth has a wireless proportional brake controller installed). BE SURE TO PLUG THE 7 PIN CONNECTOR WITH THE PROPER HOLES AT TOP AND BOTTOM. FAILURE TO DO SO MAY DAMAGE YOUR HABITAT WIRING AND ELECTRIC BRAKE SYSTEM.

We recommend disconnecting the 7-pin connector from the tow vehicle when camping

When hitching and unhitching, be sure to move the 7-pin connector cord so it does not get damaged by, for example, the hitch and/or pin box. Do not allow the cord to drag on the ground and cover with a rag or soft cloth when not in use. Keep the connector clean and dry, and follow manufacturer instructions for cleaning if necessary. See also “Hitching” section for further discussion regarding your 7-pin connector.

If you have a mounted air conditioning unit, it will operate only on external 120V power from a home, campground or a generator. There is a dedicated 120V outlet located close to the air conditioner’s location. Important Note: you must refer to the manuals and other instructions of any and all appliances, add-ons and/or accessories regarding their respective electrical requirements.

120V circuit breakers ... 120V circuit breakers are located inside your converter/charger box, which is located on the driver’s side rear of the habitat interior beneath the berth. They control the circuit between the 120V inlet and the 12V power provided in the habitat. If your circuits trip because of overload, reduce the load and reset the breaker.
WARNING: NEVER REPLACE INSTALLED CIRCUIT BREAKERS OR FUSES WITH CIRCUIT BREAKERS OR FUSES OF HIGHER AMPERAGE RATING THAN THOSE ORIGINALLY INSTALLED. THIS COULD OVERHEAT THE WIRING AND START A FIRE.
A fuse in the circuit between the tow vehicle battery and an electric cause the controller to cease function.

12 AWG (Blue) Brake Power
BATTERY

Overview ... one or two DEEP CELL 12-volt batteries may be supplied with your habitat. It is specified and installed by your dealer.

WARNING: MANY BATTERIES CONTAIN SULFURIC ACID, WHICH IS HIGHLY CORROSIVE, FLAMMABLE AND EXTREMELY DANGEROUS. THUS, WE STRONGLY RECOMMEND THAT YOU HAVE ALL BATTERY MAINTENANCE, SERVICING AND INSTALLATION PERFORMED BY A QUALIFIED TECHNICIAN.

The battery and charging system are the heart of the 12-volt DC system. Thus, it is important that you keep the battery fully charged and monitor its charge state. Low battery charge and/or bad batteries are common causes of poor appliance and other component part performance. Fuses and circuit breakers can fail even without a short circuit under low voltage.

The converter/charger system in your TigerMoth will help you manage your electrical requirements and charging needs. The converter/charger monitors and charges your batteries as needed when connected to a power supply. Please refer to the manufacturer’s information regarding the converter/charger for more information. This is supplied with your habitat. Please also refer to the “Electrical System” chapter herein.

Battery Cut Off Switch / 120V Outlets/ WFCO power center / 12V outlet / USB Outlet / Voltmeter

There is a 12v monitor in the headboard of your TigerMoth near the 12v accessory outlet and the USB Outlet. This will let you monitor current or charging voltages.

Your habitat will generally be in one (1) of the following three (3) power states when in use: (1) dry camping (not connected to shore power) ... you will be using battery power only to operate lights, fans and other DC components, and thus, discharging the batteries. Exercise constant vigilance in keeping your battery charged when dry camping. Make every reasonable effort to conserve your battery power (i.e. turn off lights and appliances when not being used);

(2) being towed ... if your tow vehicle has been wired properly, your habitat’s battery will charge while being towed (the rate of charge varies depending on the tow vehicle); and

(3) connected to shore power ... when you are connected to shore power (an external 120V power source), all batteries will charge automatically and will be regulated by your converter/charger so they don’t overcharge. This is the fastest method of recharging your habitat. Connect to shore power through the marked 15 amp electrical inlet located on the rear driver’s side of your habitat. Note: when parking the habitat for more than a few days, detach from tow vehicle, turn off appliances and lights, and plug in to shore power if available to ensure the battery is charged in advance of next use.
4. Connected to solar panels when off the grid. TigerMoths are prewired to accept specific solar panels (via the inlet at the rear driver’s side of the habitat, or on the driver’s side exterior). The rate of charge will vary based on the panels and solar exposure. Please refer to specific makes of solar panels accepted by this solar power inlet on the sticker located near this inlet.

Installation... proper battery installation is critical. Thus, please see a qualified technician for the installation and/or replacement of your habitat batteries.

Inspection and monitoring... we recommend that you inspect and monitor the charge of the battery at least once a month and prior to any trip. During your inspection, look for cracks in the cover and case, and check vent plugs. Have a qualified technician replace any cracked or broken plugs or other such items, and confirm that the hold-down hardware is tightly secured, that the battery box, tray or compartment is clean and free of corrosion, and that the vent caps and terminals are secure and tight. Note: Do not store anything in the habitat battery compartment, box or tray other than the battery and its various components.

Charging and storing... keep the batteries fully charged but be sure not to overcharge the battery. If the habitat is charging via a power cord, shore power, your power distribution center will prevent overcharging. To check or monitor the battery charge, insert the readout accessory into any 12V outlet on the TigerMoth.

Here are three ways to charge your battery:
1. Plug into any 120V outlet via the inlet located on the rear driver's side of your TigerMoth.
2. Plug the habitat's 7-pin connector into an appropriately wired tow vehicle while the vehicle's engine is running.
3. Plug compatible solar panels into the inlet located on the rear driver's side of your TigerMoth.

When camping, detach 7-pin connector from tow vehicle. Otherwise it is possible that the habitat may drain the tow vehicle's battery.

When habitat is in storage, maintain the battery by plugging a 120V power source into the Tigermoth electrical inlet (located at the rear driver's side). The charge controller will maintain a proper charge without overcharging.

Or

Use the battery cut off switch located under the berth cabinetry to disconnect battery. (When battery disconnect is in OFF position it is still possible to charge the battery from the two vehicle or solar panel)

dead batteries.... If your battery is dead, plug into shore power if available. Reduce the loads on the battery by turning off any lights, 12-volt DC powered equipment and all non-essential items to allow rapid recharge. You may also connect the 7-way connector to your tow vehicle and run the engine at high idle to increase charging current and possibly reduce charging time. If your tow vehicle battery is dead or discharged, an external jumper battery or battery charger must be used to either start your tow vehicle engine, or generator, if any.
APPLIANCES AND FIRE EXTINGUISHER

The following appliances may be optional. If you choose to equip your habitat with any options, please be sure to read and follow the separate manuals and instructions regarding safety, risks, use, maintenance, care and service associated with each option, add-on, appliance and/or equipment.

**air conditioner ...** the air conditioner unit (AC), if any, will plug into an appropriately rated power outlet, and is not compatible with your TigerMoth™’s battery system. Remember that your air conditioner’s performance depends largely on the heat levels/stresses on your habitat. Habitat heat stresses may be reduced as follows:
- Park in a shaded area / Keep blinds down and closed / Keep windows and doors closed, allowing the habitat to cool efficiently / If you have an awning, use it to protect habitat from direct sunlight / Try to avoid using heat-producing items inside habitat / Turn on the AC unit early in the morning / Maintain AC unit as instructed by manufacturer

**FIRE EXTINGUISHER and SMOKE DETECTOR and CARBON MONOXIDE DETECTOR**

Your habitat includes a fire extinguisher, which is located in the rear of the TigerMoth™. Test and operate according to manufacturer instructions.

Your habitat also includes a battery powered smoke detector and a separate carbon monoxide detector, which should be tested prior to and during each camping trip.
PRE-TRAVEL CHECKLIST

interior ...
- turn off all switches at kitchen switch panel.
- turn off and close all appliances, if not in use. You may keep the refrigerator on while driving.
- be sure your cargo berths are secured, and close and latch all windows
- be sure both side and rear doors are is closed and latched properly inside and outside.
- be sure shoreline power cord, 7-pin connector and hoses are secured (and properly attached, if applicable).
- close and lock all doors.
- be sure the stabilizer jacks and door step ladder are fully raised and secured.

exterior ...
- check tire pressure and the tires generally for any punctures, cuts, and other problems.
- be sure wheel lug nuts are tight and secure.
- check that all tow vehicle and habitat lights and brakes are working in synchronization.
- check brakes with multiple applications in an empty parking lot.
- confirm brake controller, if any, is operating properly.
- be sure hitch assembly is secure, and that safety chains and breakaway switch have been properly attached.
- check underneath habitat for any damage or displacement.

WARNING: DO NOT ALLOW ANYONE TO RIDE IN HABITAT WHILE IT IS BEING TOWED.

Important Note: This is not an exhaustive list nor is it intended to be. Use common sense when preparing for a trip and all other helpful resources available to you.

OTHER IMPORTANT PRE-TRAVEL CONSIDERATIONS
- be sure to pack wheel chocks and blocks.
- be sure roof rack cargo, if any, is secure.
- be sure to monitor your battery's charge before and during your trip. Charge battery before travelling, if necessary.
- tow vehicle ... read and follow the manual and all pertinent instructions provided to you by your tow vehicle manufacturer.
- be sure tow vehicle is operating fully before any trip, correcting any problems before travel.
- bring flashlight and batteries.
- make sure your cell phones are charged and that you have phone chargers.
- bring extension cords, if necessary.
- Take spare tire.
- check for any potential fire hazards, and eliminate them, if any.
- weigh your load before trip, making sure it does not exceed your GVWR.
SITE SELECTION AND SET UP

With time and experience, you will get better at spotting and identifying good camping sites. Although they will vary to some degree, all good sites will (a) be level and (b) have a firm, not soft, ground that will support the weight of jacks and/or other support devices. There are also many public camping sites that provide electrical and other useful hook-ups or services. Once you have chosen your site, we suggest that you refer to the following important tips for your set-up:

level and stable .... (1) Before uncoupling, level the unit from side to side if desired with wood or plastic leveling blocks. Place the blocks on the ground forward of the wheels and tow the unit onto the blocks. Use wheel chocks to be sure the unit cannot roll;
(2) Lower the jack onto blocks or pad, if necessary;
(3) Use your provided habitat level to ensure habitat is level;
(4) Once the unit is level, use wheel chocks or blocks to prevent the habitat from moving;
(5) uncouple the habitat from the tow vehicle, unplug 7 pin connector from vehicle; and
(6) Lower the stabilizing jacks until they firmly engage. Be sure all jacks have about the same pressure on them.

Note: Before resuming travel, be sure that the stabilizer jacks are fully retracted/raised and that the habitat has been fully closed.

WARNING: DO NOT ATTEMPT TO USE JACKS STANDS OR STABILIZER JACKS TO JACK UP THE HABITAT OR SUPPORT THE FULL WEIGHT OF THE HABITAT. DO NOT ATTEMPT TO LEVEL, RAISE OR OTHERWISE PLACE ALL OF THE WEIGHT OF THE HABITAT ON THE STABILIZER JACKS. STABILIZER JACKS ARE NOT DESIGNED TO BEAR WEIGHT.

set-up cont. ... once the unit is safely leveled and stabilized, continue with set-up:
(1) connect to shore power, if available;
(2) set up the remaining features and/or options as needed.

Awning Instructions

An awning or shade structure can be a very useful addition to your TigerMoth. Shelter from the sun, rain and bugs can be achieved with different styles.

Numerous attached awnings or shade structures can be used with a TigerMoth. TAXA has provided many attach points on the rear of the TigerMoth, over the kitchen drawer, to which many sorts of awnings can be tied off too. Freestanding shade structures can also be used.

Please refer to manufacturer’s instructions.
Privacy Shelter Instructions
A privacy shelter or cabana can be a very useful addition to a TigerMoth. These are most often freestanding. These private spots can be used for showering off, changing clothes or bathing suits or can be an outside the habitat spot for a porta potty. There are many models on the market.
VENTILATION

Overview... good ventilation and indoor air quality is essential to long-term enjoyment of your habitat. Inadequate ventilation can increase indoor pollutant levels. To maintain good air quality, be attentive to proper ventilation of your habitat, keep it clean, and prevent and avoid unnecessary air pollutants. Common indoor air pollution sources include molds, pollen, pet fur dander, secondhand smoke, carbon monoxide from burning propane and other fuels, and household cleaners.

Travel habitats are much smaller than homes. Thus, the exchange of air inside a travel habitat is significantly less than a home. Proper ventilation is an ongoing process, occurring before, during and after use, and at times when the temperatures and humidity are elevated. Decreasing the flow of air by sealing the travel habitat may increase the presence and/or concentration of indoor air pollutants, such as but not limited to, molds and household chemicals. Improve ventilation by opening windows, using fans and opening vents, running the air conditioner, or some combination thereof. We also recommend that you do not smoke or use any type of bug or other chemical spray inside your habitat.

WARNING: Your habitat was designed for recreational use and short-term occupancy only. Long-term occupancy can create conditions, which if not managed properly, can be hazardous to your health and cause significant damage to your habitat.

The following are three (3) basic strategies recommended by the Environmental Protection Agency (EPA) to improve indoor air quality:

1) Remove sources... eliminate sources of pollution and/or reduce their emissions. Pollutants that this strategy can have an impact upon are: (i) Biological Contaminants such as bacteria, molds, mildew, viruses, animal dander, and pollen, (ii) Household Products such as paints, varnishes, cleaning and disinfecting solutions, cosmetics and hobby products, and (iii) Pesticides.

2) Ventilation... increase the amount of outdoor air coming indoors. Typically, habitat air conditioners, for example, do not mechanically bring fresh air into the unit. Simultaneously opening doors and windows to allow fresh air in along with turning on fans to take inside air out is an effective way to improve ventilation. Remember, if there is insufficient outdoor air entering a habitat, pollutants may accumulate to higher levels.

3) Air cleaners... air cleaners are designed to remove particles from the air. There are many types and sizes of air cleaners available to you on the market. Note: Air cleaners are not generally designed to remove gaseous pollutants. The effectiveness of an air cleaner depends on how well it collects pollutants from indoor air and how much air it draws through the cleaning or filtering element. For more information about Ventilation, Indoor Air Quality and its effects, please refer to www.epa.gov/iaq.

MOISTURE/CONDENSATION

The relatively small volume and compact construction of travel habitats means that the normal activities of even a few persons can lead to rapid, visible moisture saturation in the habitat, especially in cold weather. Note: some estimates indicate that a family of four can vaporize up to three gallons of water through daily breathing, cooking, bathing and washing. Just as the moisture collects on the outside of a glass of cold water during humid weather, moisture will condense on the inside surfaces of the habitat during cold weather when the relative humidity of the inside air is high. The insulated walls of your habitat are also much thinner than house walls, worsening the condition. Unless water vapor is carried outside, it will condense on the inside of the windows and walls. Thus, when you observe signs of excessive moisture and condensation in the habitat, take action to minimize the effects. Such action steps in non-extreme hot or cold weather conditions may include but not be limited to the following: Allow excess moisture to escape by ventilating with outside air. Open windows to provide circulation of outside, dryer air to the inside. While this ventilation may increase the heating load during cold weather, it will greatly reduce water condensation.

Minimize moisture released inside the habitat such as steam from excessive boiling water or other use of hot water. Remove water or snow from shoes before entering the habitat. Avoid drying wet or damp clothing, towels, gear and other items inside the habitat.

In hot, humid weather, start the air conditioner, if applicable, early in the day.

Manage the inside temperature during cold weather. Remember that the higher the temperature inside (in cold weather) will cause condensation to form on areas that are not insulated as well as others (windows, vents, wall studs, etc.); try to avoid drastic, quick temperature reductions, which can increase moisture condensation inside.
Properly maintain and secure the exterior of the habitat. This will help keep a tight barrier against water intrusion. Note: using your habitat in severe climates or weather conditions (which is NOT recommended ... see “severe weather use” section), such as extreme hot, humid or cold weather, will require extra care, attention and maintenance of moisture-related issues and relative humidity conditions inside the habitat.

Other tips to minimize condensation
When, for example, washing dishes, hair drying, laundering, cooking and using appliances and non-vented gas burners, keep a window partially or fully open turn on your fan, if any; Keep all doors and vents open when practicable; Allow air to circulate inside cabinets (leave doors partially open) so the temperature inside the cabinet is the same as in the rest of the unit. Clean any spills immediately.

On laminated surfaces and the floor (use mold or mildew-killing cleaning products. Check sealants regularly and reseal when necessary to avoid water leaks. Use LED, or fluorescent lights and minimize prolonged use of incandescent lights, which produce heat and may contribute to condensation issues.

Remember ... your natural tendency may be to close the habitat tightly during cold weather. This will actually make any moisture/condensation problems worse. You need to ventilate the habitat, allowing inside air to travel outside.

Note: If the tips outlined here are not effective in controlling condensation, it may be necessary for you to invest in a dehumidifier to reduce the health risk to you or your family as well as prevent damage to your habitat.

MOLD
Molds are pollutants found in virtually every environment. Left unchecked, molds break down various materials such as wood products and fabrics. Mold can rapidly grow indoors if it is warm and humid. By controlling relative humidity (moisture) as outlined herein, the growth and potential for growth of mold and mildew can be greatly reduced.

Additional Web Resources
We also recommend that you visit the following web sites which maintain information about indoor air pollutants, including molds and formaldehyde, along with ways to improve indoor air quality:

http://www.epa.gov/iaq/pubs/insidest.html
http://www.atsdr.cdc.gov/tfacts111.html
http://www.epa.gov/iaq/molds/moldguide.html
http://www.formaldehyde.org/
http://rvia.org/ (Recreational Vehicle Industry Association’s Web site – Under the Technical Information

WARNING: Taxa Inc. carefully chooses the production/manufacturing materials for its habitats. However, Taxa Inc. does not warrant or otherwise represent that its production/manufacturing materials are formaldehyde free.
FOUR SEASON USE / SEVERE WEATHER USE

Your habitat was NOT designed for use in extreme climates or weather situations. It was designed to be used any season you wish. Some conditions require special consideration or preparations.

If conditions are extreme due to weather or other natural or unnatural causes BE SAFE!

Get yourselves to safety. Get your vehicles to safety as a secondary concern.

Your habitat was designed for short-term use (typically seven days or less) in normal, moderate temperature and climate conditions. Normal, moderate temperatures are between 32 degrees F and 100 degrees F. Climates falling outside of this range are considered extreme for purposes of this manual and your habitat. Be advised that some of your habitat’s systems and components are not appropriate for use in extreme climates (see further notes below). Please be advised that some damages, losses or injury arising out of use of your habitat in extreme climate conditions may not be covered under the Limited Warranty. See Limited Warranty section herein. Thus, before you consider using your habitat in extreme conditions, please read the following:

plumbing system … You can comfortably camp in winter! However, your drinking water should come from portable water containers that you can keep unfrozen or do not care if they freeze.

insulation and heat .. keep the inside of the habitat heated and insulated. Use your furnace that is integrated into the habitat to keep interior temperatures modulated. Follow all manufacturer’s instructions for safety.

additional tips .... Supply your habitat with bottled water for drinking, cooking, washing and brushing your teeth.

battery and electrical systems … If you are connected to shore power or have a generator, you should have all the power you need to operate appliances. You can easily run your furnace or, if with shore power, can plug in a portable electric heater. However, if you are dry camping (i.e. no shore power or generator), your battery or batteries will be your only source of power, and thus, your primary electrical system concern in extreme cold. Be sure to keep the battery charged and conserve available energy when possible. Remember that there is no substitute for common sense when camping in extreme weather conditions. Please also refer to the “Battery” and “Electrical System” sections herein.

EXTREME HEAT and COLD

Please use common sense when camping. Extreme heat and extreme cold can cause injury and or death, especially to the elderly and young. Take all necessary precautions when camping.

Here are some notes for camping in:

WINTER:
- bring bottled water for drinking, washing, brushing teeth etc. Keep those plumbing lines and tanks free from water in prolonged freezing conditions.
- your furnace will keep you warm and toasty even with the roof up. We have been to well below freezing in our experiences.
- have a good sleeping bag, zip two together
- some people close the roof at night for extra insulation

SPRING:
- no special considerations unless you are up high or far north where temps may drop below zero at night.

SUMMER:
- your habitats roof is insulated! on the hottest of days being inside is like being on a porch – shady and with great cross-ventilation. Have a siesta in the middle of the afternoon and stay up late!
- get a clip on 12v fan or two!
- some climates support swamp cooler use.
- (some need an AC)

FALL:
- no special considerations unless you are up high or far north where temps may drop below zero at night.
GENERAL CARE AND MAINTENANCE

Regular care & maintenance of your habitat is important in furthering safety and dependability. Keep good records of all service and maintenance performed on your TigerMoth. These records may be necessary for limited warranty purposes or may assist in future repairs. Always refer to the manufacturers’ care and maintenance recommendations for installed appliances.

exterior finish ... your habitat's exterior is made of painted aluminum composite panels, which are durable and easy to maintain. Aluminum is lightweight and relatively soft, naturally showing wear over time. Cosmetic marks are intrinsic to aluminum and do not constitute a fault in material or defect in workmanship. Routine maintenance is the best way to minimize and guard against cosmetic changes due to weathering. Wash the habitat exterior with a soft cloth, warm water and soap thoroughly, paying special attention to the graphics. Never use strong solvents or abrasives when cleaning. Also, be aware that power buffers and high pressure washers may damage or totally remove the graphics. See also the following summary of do's and don’ts:

Do use soft cloths to clean
Do be careful around graphics, washing with the graphics, not against them.
Do not use products containing ammonia or caustic, harsh cleaning agents.
Do not use high-pressure washers, rotating brushes (i.e. in-car wash facilities), or power buffers.
Do not dry wipe surfaces
Do not use rubbing compounds.

frame and chassis .... Over time, various weather and climate conditions may lead to corrosion your habitat frame and chassis. Be sure to rinse the habitat undercarriage, wheel wells, hitch and bumper of all dirt, oil, tar, salt and other debris periodically and as needed. Remember to routinely inspect for evidence of rust. Do so frequently when camping in or near coastal regions.

hitch couplers ... Inspect hitch couplers before each trip. Clean and lubricate the ball socket and clamp monthly using wheel bearing grease. If hitch assembly and coupler appears damaged in any way, contact your dealer and resolve the problem before travel.

safety chains ... Inspect safety chains before each trip. Replace them before travelling if they are damaged or compromised in any way.

jack ... Inspect and test the jack before each trip. Clean and lightly apply oil periodically and as needed. If your jack needs repair or other service, see a qualified technician.

tires and wheels ... inspect your habitat tires, checking air pressure regularly and before each trip. Keep them inflated to recommended pressure, which is located on the tire sidewall. Keep a tire gauge in your tow vehicle or habitat. Have the tires rotated by a qualified technician at least every 5,000 miles.

sealants ... Inspect all sealants/seals (i.e. doors, windows, plumbing components, undercarriage) every ninety (90) days, when the seasons change, and before each trip. During your inspection, look for cracks, voids, shrinkage, and any other sign of deterioration. Replace sealant where necessary, using the same type of sealant. Contact your dealer or Taxa Inc. for suggestions concerning replacement sealants.

ceiling, interior walls, countertop and table ... clean with soap or other mild, non-abrasive cleaner, warm water, and a damp cloth. Do NOT use strong, harsh chemicals, and limit water/moisture exposure to ceiling and walls when cleaning. Excessive moisture may damage ceiling and walls. Be sure thoroughly dry ceiling and walls after cleaning. Avoid using abrasive pads and scouring powders, which may dull surfaces and increase exposure to future staining.

fabric and upholstery ... V-Berth cushions are made of a fixed marine-grade vinyl. Clean them with a damp cloth and mild soap or other cleaning product. Be sure to dry thoroughly after cleaning. Folding couch cushions are made of nylon which may be machine washed cold and air dried.
STORAGE, WINTERIZATION & BRINGING OUT OF STORAGE

If storing your habitat in persistently cold weather (less than 20 degrees F), you must prepare your habitat appropriately. We recommend that you store your habitat in a dry, level, well-ventilated area protected from the elements. Use blocks, chocks or ramps for the wheels, if necessary. A garage is ideal. Refer to and follow the following storage preparation guidelines:

**Interior**
- Open your storage compartments, remove all food items or items that may contain moisture, block lid open to provide air movement
- Spread out your upholstery so that air can reach all sides
- Open all cabinet doors and drawers, including interior storage area
- Place containers of moisture-gathering beads in the habitat
- Clean the floor, walls and all surfaces

**Chassis**
- Lubricate all grease fittings on the axle hubs
- Check all tires for damage and set tire pressure to the maximum as indicated on the tire sidewall. Clean the tires and wheels with your regular soap/car wash solution
- Clean the tires and wheels as well as the underside of the habitat. Wash off mud and/or other road accumulations on frame, axles, and other components. Inspect and make note of damage to or in any areas or components.

**Exterior**
- Close all vents and windows and thoroughly wash the exterior, including roof, sidewalls and front and rear.
- Note any maintenance issues that arise that may be needed. Inspect the sealants around roof accessories (vents, racks, etc.), windows and doors, resealing as necessary before winter rains or snows accumulate (to prevent leaks when snow melts in spring)
- Vacuum or sweep away branches, leaves, and any other debris. Wash with a mild, natural soap to reduce mildew. Allow to dry completely before retracting the awning.
- Be sure all exterior components, attachments, etc. (breakaway switch, cords, safety chains) are secured

Prevent habitat from rolling unexpectedly during storage - chock wheels, raise levelling jacks and retract step assembly.

**Electrical System**
- Preparation and winterization of the electrical system primarily revolves around your battery. Proper battery storage helps ensure both the powering up of your habitat systems on your next trip, and maximizing the life of your battery.
- Refer to the “Battery” section of this manual for proper storage information. Important Note: remember to turn off all electric loads in your habitat prior to storage.

**Bringing Out of Storage**
If your habitat was properly and carefully stored and winterized, taking it out of storage and prepping it for another travel season should be relatively simple. Note: if your habitat sustained damage while being stored, please consult with your dealer or Taxa Inc. for information regarding repair or service options. The following checklist assumes that you stored your habitat with care:

Thoroughly inspect the habitat exterior, looking for animal nests in, for example, wheel wells, compartments or openings.
- Open all doors and compartments, checking for animal or insect intrusion, water damage, or other deterioration
- Check charge level in all batteries and recharge as needed.
- Check tire pressures and re-inflate to specified cold pressure
- Lube chassis
- Check all exterior lights, and replace as needed
- Check all 12-volt DC circuit fuses
- Operate all 12-volt DC lights and equipment
- Test the carbon monoxide detector as manufacturer’s instructions (if equipped).
- Check your shore-line power cord, 7-pin connector, converter, all outlets, and any exposed wiring. If defects are found, refer service to your dealer
- Operate air conditioning system (if equipped)
- Inspect and clean the interior
- Check sealants on and around the roof, body seams and windows, resealing as needed.
- Wash the exterior, thoroughly flushing the habitat underside.

**LIST OF AUTHORIZED DEALERS**

Our dealers and their contact information are subject to change. Please refer to our website [www.taxaoutdoors.com](http://www.taxaoutdoors.com) for updated dealer and contact information lists.
your TigerMoth LIMITED WARRANTY

We want you to enjoy your TigerMoth without problems. As the owner, you are responsible for regular care and proper maintenance of your TigerMoth. Proper use, care, and maintenance will help avoid situations under which the Limited Warranty will not cover items due to neglect or misuse. Maintenance should be performed in accordance with this manual as well as the corresponding component manufacturer’s manuals included within your habitat. If you have any questions at all regarding proper care or maintenance, please contact your dealer or Taxa Inc.

This limited warranty gives you specific legal rights. You may also have additional legal rights, which vary from state to state. Taxa Inc.’s warranty obligations are limited to the terms set forth herein and applicable law. Any additional statements concerning this limited warranty not included herein, whether oral or written, are not the responsibility of Taxa Inc. and should not be relied upon by you. Please contact us if you have any questions regarding the following limited warranty.

LIMITED WARRANTY COVERAGE

Coverage - Plumbing and Electrical Systems

Defects in material and workmanship in the plumbing and electrical systems as originally installed by Taxa Inc. only. The duration of this Limited Warranty for the plumbing and electrical systems is for a period of one (1) year, beginning on the date of purchase by the original owner/purchaser and ending one (1) year from such date.

Coverage – Structural

Defects in material and workmanship in the structure of your habitat as originally installed by Taxa Inc. only. The duration of this Limited Warranty for the structure is for a period of two (2) years, beginning on the date of purchase by the original owner/purchaser and ending two (2) years from such date. The structure includes only the frame, wall framing, floor framing and their connection to each other. It does not include attachments to the structure. Attachments include but are not limited to the following: axles, tented sides, stabilizer jacks, steps, couplers, vents, windows, shades, roof tracks, roof racks, appliances, add-ons, accessories, component parts, air conditioning unit, and refrigerator.

Taxa Inc. will, in its sole discretion, repair or replace, as necessary, the covered material or workmanship, at no cost to you and within industry standards. Taxa Inc. will also, in its sole discretion, use the same, substantially similar, new, remanufactured, refurbished, and/or reconditioned components, parts, materials and/or systems in fulfilling its obligations under this Limited Warranty. Taxa Inc., in its sole discretion, shall determine whether the dealer, service center, or other authorized facility is the appropriate location to perform the covered warranty repairs or replacement, if any. You shall be responsible for delivering the habitat to the dealer, service center or other facility designated by Taxa Inc. for such covered repairs or replacement, if any.

After a repair is performed, inspect it thoroughly. Go over the repairs with the dealer and/or service center representative. Upon your satisfaction, sign the repair order. In the event a problem should reoccur after you have left the dealer or other authorized facility, contact the dealer or Taxa Inc. as soon as possible so that the situation can be resolved quickly.

Owner’s Responsibilities

Your responsibilities include: (1) carefully reviewing and following the information and instructions contained within this manual and all supplied component manuals; (2) proper care, use and maintenance of your habitat as outlined by this manual and all supplied component manuals; and (3) returning your habitat to an authorized dealer, service center or other facility authorized by Taxa Inc. to perform any necessary, covered warranty repairs, service or replacement.

WHO IS COVERED BY THIS LIMITED WARRANTY

Only the original purchaser/owner of the unit is covered under this Limited Warranty. This Limited Warranty is not transferable and does not cover subsequent purchasers/owners of the unit.

HOW TO PROPERLY SEEK A REMEDY UNDER THIS LIMITED WARRANTY

(1) Written or electronic notice of your warranty claim or claimed defects along with (2) your dated receipt as proof of purchase must be given either to the selling dealer or Taxa Inc. not later than ten (10) days after the expiration of the applicable limited warranty duration period as defined herein. Otherwise, your warranty claim will be considered untimely. Failure to timely notify of a warranty claim will void this limited warranty.

If your dealer is unable to resolve your warranty claim or you would like to first notify us of your warranty claim, please contact

TIGERMOTH™ taxaoutdoors.com.
7930 blankenship drive, houston, tx 77055  (rev.03092021)
us as follows:

Taxa Inc., 1830 West 15th Street, Houston TX 77008, Tel: 713.861.2540, and Email: hello@taxaoutdoors.com. Please also visit our website www.taxaoutdoors.com for any updated contact information.

SOLE AND EXCLUSIVE REMEDY
TO THE MAXIMUM EXTENT PERMITTED BY LAW, THIS LIMITED WARRANTY AND THE REMEDY EXPLAINED HEREIN ARE EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES, REMEDIES AND CONDITIONS, WHETHER ORAL OR WRITTEN, EXPRESS OR IMPLIED. TO THE MAXIMUM EXTENT PERMITTED BY LAW, TAXA INC. SPECIFICALLY DISCLAIMS ANY AND ALL IMPLIED WARRANTIES, INCLUDING WITHOUT LIMITATION, WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE FOREGOING DISCLAIMER OF IMPLIED WARRANTIES SHALL NOT APPLY TO YOU OR THE HABITAT IF SUCH DISCLAIMER IS IMPERMISSIBLE UNDER APPLICABLE LAW.

WHAT IS NOT COVERED UNDER THIS LIMITED WARRANTY/EXCLUSIONS

This limited warranty does not cover any damage, loss, deterioration or malfunction resulting from any alteration, modification, improper or unreasonable use or maintenance, misuse, abuse, tampering, accident, neglect, exposure to excess moisture, fire, lightning, power surges, and/or acts of nature or God. This limited warranty does not cover any damage, loss, deterioration or malfunction resulting from any repairs attempted by anyone unauthorized by Taxa Inc. to make such repairs, or any other cause which does not relate directly to a defect in materials and/or the workmanship of this unit.

Without limiting any other exclusion herein, Taxa Inc. shall not be liable for any incidental or consequential damages, including but not limited to travel, transportation, and lodging expenses, loss or damage to personal property, loss of use, inconvenience or loss of income whenever allowable under state law. Damages for any failure to successfully repair or replace any defect in accordance with this limited warranty shall be limited to the reasonable cost of such repair or replacement as of the time of the alleged failure or defect. This exclusion of consequential and incidental damages shall be deemed independent of, and shall survive, any failure of the essential purpose of this limited warranty.

THE FOLLOWING NUMBERED LIST (1 THROUGH 24) IS NOT EXHAUSTIVE AND DOES NOT LIMIT ANY OTHER EXCLUSION OR LIMITATION DISCUSSED HEREIN OR PERMITTED BY APPLICABLE LAW. THIS LIMITED WARRANTY SHALL NOT COVER NOR APPLY TO:

(1) Items not manufactured, installed or sold by Taxa Inc., whether warranted separately or not by their respective manufacturers, including but not limited to, tires, batteries, fuses, ac units, heaters, refrigerators, porta-potty’s, roof racks, generators, structural and other modifications, and all other such equipment, products, accessories, components, parts, add-ons, appliances, and attachments;

(2) Habitats used for and/or damage or loss arising from business, rental, commercial, residential, or disaster relief purposes/uses, and/or any non-recreational purpose/use;

(3) Habitats not originally sold through an authorized Taxa Inc. dealer;

(4) Habitats sold through auction, repossession, salvage or in an otherwise "distressed" condition, etc.;

(5) Damage or loss caused in whole or in part by the acts or omissions of any kind by any party other than Taxa Inc., its agents, representatives or employees;

(6) Damage or loss caused in whole or in part by misuse, abuse, neglect, theft, vandalism, product modification, improper owner, customer or dealer installation, incorrect line voltage, unauthorized repair or failure to properly maintain and/or to follow instructions in accordance with this manual. In particular but not limited to, damages from failure to regularly check, inspect and maintain sealants and seals around roof penetrations, attachments, windows, doors, joints, and seams shall not be covered under this limited warranty;

(7) Routine/normal maintenance and service items including without limitation, caulking, re-caulking and waxing of the body of the habitat, tightening screws, brakes, latches, locks, changing fuses, or light bulbs, maintaining the batteries, air conditioning, heating, plumbing and electrical systems, lubricants, sealant and seals, etc., and/or damages resulting from lack of proper maintenance and servicing;

(8) Adjustments to all doors, drawers, locks, latches, slide-outs, awnings and window treatments after ninety (90) days of the date of the original retail sale;
(9) Damage or loss caused in whole or in part by unauthorized attachments, modifications or alterations to the structure, body, pin box, or frame of the unit including but not limited to habitat hitches, or platforms for supporting cargo;

(10) Normal deterioration due to wear or exposure such as but not limited to upholstery damage, fading of fabrics, drapes, carpet wear, tears, punctures, dents and/or scratches to the exterior from the roadway, hanging branches, etc.;

(11) Damage or loss caused in whole or in part by the overloading or the improper balancing/distribution of the load;

(12) Damage or loss caused in whole or in part by the willful or negligent acts of the driver of the tow vehicle, an accident involving the habitat, the condition of any road surface over which the habitat is pulled, or the striking or driving over or through a curb or any other object;

(13) Damage or loss to the habitat caused in whole or in part by the tow vehicle including but not limited to the improper selection or installation of towing hitch and hitch assembly on the tow vehicle;

(14) Any injury, loss or damage due to mold, bacteria or fungi;

(15) Damage or loss caused by or arising from the operation, use, or misuse of the tow vehicle;

(16) Any and all damage or loss to the tow vehicle;

(17) Damage to electronics due to voltage issues;

(18) Representations made by any person (including your dealer) beyond those stated in this Limited Warranty;

(19) Any incidental and consequential damages or loss, and extra expenses including, but not limited to, transportation generally, transportation to and from dealer or authorized service center or manufacturing location, loss of time, loss of pay, loss of use of the habitat, inconvenience, commercial loss, towing charges, bus and taxi fares, vehicle rental, telephone calls, fuel, food, lodging, etc.;

(20) Damage caused by or related to: (a) Accidents, misuse, recklessness, indifference, or negligence; (b) Failure to comply with instructions contained in this Owner's Manual or any other manual related to your unit; (c) Alteration, change or modification of the habitat or damage incurred resulting from alteration, change or modification; and (d) exposure to natural atmospheric elements or environmental conditions, chemicals, ash or fumes generated or released by vehicles or any other item, collision, road hazards, rock chips, condensation, or any other source (salt, hail, Acts of God, etc.);

(21) Damages related to moisture, condensation, mold, saturation or water;

(22) Damages to your cargo or tow loads;

(23) Damages resulting from or related to the use of your habitat in extreme weather conditions as defined in the “severe weather use” section of this manual.

(24) Any item not specifically listed in the coverage paragraphs of this section.

APPLIANCES/COMPONENT PARTS/ACCESSORIES

Be advised that the manufacturers of some, if not all, of your habitat's appliances, component parts, add-ons and accessories will offer you their own separate warranties. Such wholly separate, additional warranties, if any, are administered directly from and are the sole responsibility of the manufacturer of the specific component part or appliance. Taxa Inc. has no responsibility nor does it have any obligation related to these wholly separate, additional warranties, if any.

You are solely responsible for timely completing and forwarding warranty forms and registrations, and the proper processing of all warranty claims for all components, add-ons, and appliances installed in your habitat. Failure to do so may result in loss of warranty coverage by the component or appliance manufacturer. Note: upon your request, Taxa Inc. may, in its sole discretion, reasonably assist you in the processing of such separate warranty.

LEGAL CONSIDERATIONS

Choice of Law . . . to the maximum extent permitted by Law, the laws of the State of Texas shall apply to the terms of this Manual and Limited Warranty, and any and all disputes arising out of any limited warranty claim or the purchase or repair of your habitat.

Venue . . . to the maximum extent permitted by law, Houston, Harris County, Texas shall be the proper venue for any suit filed by you arising out of any limited warranty claim or the purchase or repair of your habitat.

Mediation . . . to the maximum extent permitted by law, a mediation by and through an agreed upon mediator shall be conducted prior to the filing of any suit by you arising out of any limited warranty claim or the purchase or repair of your habitat.
